A look at

blockchain technology

What is it?

The **blockchain** is a decentralized ledger of all transactions across a peer-to-peer network. Using this technology, participants can confirm transactions without the need for a central certifying authority. Potential applications include fund transfers, settling trades, voting, and many other uses.

How it works:

Someone requests a transaction.

The requested transaction is broadcast to a **P2P network consisting of computers, known as nodes.**

Validation

The network of nodes **validates the transaction and the user's status using known algorithms.**

A **verified transaction** can involve **cryptocurrency, contracts, records, or other information.**

Once verified, the transaction is combined with other transactions **to create a new block of data for the ledger.**

The transaction is complete.

The new block is then added to the existing blockchain, in a way that is permanent and unalterable.

Does a digital ticket useful only for redeeming a pair of Nikes itself become a separate product if it prompts people to pay hundreds more than the shoes cost?

A court's answer to that question could have big implications amid an early wave of
